When You Can't Tube…
Impact of a Major YouTube Outage on Rapes[*]

This version: September 2019

Abstract

On Tuesday, October 16th, 2018, YouTube experienced a major and rare global service outage. Using high-frequency crime data from the U.S., we document an important increase in rapes in the 24-hour period following the outage. We then investigate various potential underlying channels that may link the YouTube outage to the subsequent observed increase in rapes (we explore a direct effect on crime, time substitution, an effect on the consumption of drugs and alcohol, and the increase in pornography viewing), and the overall evidence only supports the hypothesis that the increase in rapes was driven by an increase in pornography viewing.

Keywords: Sexual crime; sexual offenses, event study.

JEL classification: K42.

1

I. Introduction

Social media is an important part of many people's lives. Nowadays, an average adult spends approximately 54 minutes a day consuming social media.[1] Among the many social media sites available, YouTube is the most widely used site by adults in the United States. According to a national representative survey conducted in January 2019, 73% of American adults use YouTube regularly, and 51% of YouTube users say they visit the site daily.[2]

The increase in the use of social media raised an important debate in the public sphere on the potential effects of social media exposure on economic and social outcomes. Our paper contributes to this debate by studying the short-run effects of deprivation of consumption of social media. In particular, we study the impact of a major YouTube outage on subsequent rapes. On Tuesday October 16th, 2018, between 9pm and 11pm Eastern time, YouTube experienced a major and rare global service outage. Using high-frequency crime data from the U.S., we document an important increase in rapes in the 24-hour period following the outage. Our results are robust to alternative specifications and time windows.

We then investigate potential underlying channels or mechanisms that may link the YouTube outage to the subsequent observed increase in rapes. We provide various pieces of evidence regarding these potential mechanisms. First, other crimes and offenses were not affected by the outage. Second, the outage was not related to an increase in drugs or alcohol offenses. Third, the observed increased in rapes did not occur in the 2-hour period during the outage, but in the 22-hour period after YouTube service has been restored. Finally, in the 2-hour period during YouTube's disruption there was an important increase in traffic on the online adult video site Pornhub (the

world's biggest pornography site), which implied millions of additional viewers during Pornhub's peak hours. Overall, these findings suggest that the observed link between YouTube outage and rapes may be operating through the increase in pornography viewing.

There is an important literature on the drivers of sexual aggression, including rapes. This literature also discusses the characteristics of sexual crime perpetrators, and documents that most rapes are committed by relatives or acquaintances of the victim (Russell 1984, Koss et al. 1988, National Research Council 1996, Gavey 2013).[3] Though being related to this general literature, our paper is not on the causes of rapes, but on the causal effect of deprivation of a social media on rapes. As such, our paper only explains a relatively small fraction of rapes.

Our paper is related to the literature on the impact of media (mainly radio and television) on many outcomes, such as education, family choices, labor and migration decisions, environmental choices, health, crime, attitudes, consumption and savings, and financial choices (for a review of this literature, see DellaVigna and La Ferrara 2015). There is also a small and recent literature on the effects of social media. Enikolopov, Petrova, and Sonin (2018) study the impact of blog posts about corruption on the performance of state-controlled companies in Russia, and find that social media can discipline corruption. Enikolopov, Makarin, and Petrova (2017) analyze the effect of social media penetration on both the occurrence and the size of protest demonstrations in Russia, and conclude that social media can increase the ability of people to overcome collective action problems.[4]

---

[3] According to RAINN, 8 out of 10 rapes are committed by someone known to the victim (https://rainn.org/statistics/perpetrators-sexual-violence).
[4] Recent experimental research has also focused on how people react to deprivations to the consumption of social media (see Mosquera et al. 2018; Allcott et al. 2019).

Our finding that pornography viewing can lead to an increase in rapes adds to a long-standing debate in the U.S. regarding the effects of pornography. As far back as in 1968, President Lyndon B. Johnson set up the President's Commission on Obscenity and Pornography to study the effects of pornography on crime and other antisocial conducts. The Commission concluded there was insufficient evidence on a relationship between exposure to pornography and subsequent aggression, particularly in sexual crime. The report triggered an important amount of research (mainly in the fields of criminology, experimental psychology, and sociology) on the effects of pornography on sexual aggression. Ferguson and Hartley (2009) provide a review of this research and, in line with the report, conclude that pornography is not associated with increased sexual assault behavior. However, some authors have challenged these findings, providing evidence that pornography is associated with an increase in violent sexual behavior. Malamuth, Addison, and Koss (2000) provide a review of this literature and conclude that the evidence supports the existence of a positive association between frequent use of pornography and sexually coercive behavior, particularly for men at high risk for sexual aggression.[5]

Given that most of the evidence available on the impact of pornography on rapes comes from correlational studies, it is difficult to interpret this evidence in a causal way. In addition, the small amount of experimental research available focuses on hypothetical behavior in the lab. Thus, the question of whether pornography actually increases or reduces rapes is still open. Our paper provides evidence that supports the hypothesis that an increase in pornography viewing may lead to an increase in rapes.

Finally, our paper contributes to the literature on crime decision making. The rational choice theory postulates that rational agents decide whether to engage in

---

[5] For a more recent review of the literature showing a positive link between pornography and rapes, see Foubert (2017).

4

criminal activities by comparing the benefits and costs of committing a crime (Becker 1968). A recent literature shows that emotional cues or visceral factors (i.e., frustration and euphoria) also affect crime decisions, such as the decisions to engage in domestic violence (Card and Dahl 2011), violent crime (Munyo and Rossi 2013), and sexual crime (Lindo, Siminski, and Swensen 2018). In line with this literature, our results suggest that a fraction of sexual crime can be better characterized as a breakdown of control rather than a behavior driven by rational choice.[6]

The organization of the paper is as follows. Section II presents the natural experiment and describes the data. Section III presents the empirical strategy and reports the results. Section IV explores mechanisms. Section V provides a simple theoretical framework to rationalize our findings Section VI concludes.

II. Natural experiment and data

YouTube experienced a major and rare global service outage on October 16th, 2018, between 9pm and 11pm Eastern time. Users who tried to access the website during this period were greeted with a blank page that showed no videos. On the app, an error message read which said 'There was a problem with the network [503].' According to Downdetector, the first massive reports (13,650) were found at 9:01:11 pm, Eastern time.

The outage received extensive coverage in the media.[7] Figure 1 displays the evolution of daily reported problems in the YouTube site for the period May 2017 to February 2019. We obtain YouTube reports data from Downdetector, who collects status reports from a series of sources (such as Twitter). Through a real-time analysis of this data, Downdetector automatically detects outages and service interruptions at a very

---

[6] Our findings tie in with a small amount of literature in economics that studies the impact of internet availability and sexual crime (Bhuller et al. 2013, Nolte 2019).

[7] See, for example, www.msn.com/en-gb/money/technology/googles-youtube-suffers-a-major-outage/; www.cnbc.com/2018/10/17/googles-youtube-outage-affected-users-in-us-australia-asia-europe.html; www.usatoday.com/story/tech/talkingtech/2018/10/16/youtube-offline-worldwide-social-media-internet/.

early stage. An outage exists when the number of reports shows a significant jump relative to the baseline. As observed in Figure 1, there is a clear and unusual spike in reported problems on October 16th, 2018.[8]

We use high-frequency (hourly) data on reported criminal incidents in the U.S. for the period January 1st, 2017, to April 1st, 2019. This is time-series data collected by Socrata, and aggregates all reported incidents at 295 police departments and sheriffs' offices (from a total of 17,784 police departments and sheriffs' offices in the U.S.).[9]

From the original hourly data, we generate a "daily" dataset that uses the date and time of the reported incident, so that all "days" start at the time of the outage (9pm Eastern time). For example, in the new dataset October 1st corresponds to the 24-hour period that starts at 9pm Eastern time on October 1st and ends up at 8.59pm Eastern time on October 2nd. In this way we end up with 820 "daily" observations.

We define an incident as a rape if the record has the word "rape" in the primary incident type column or in the incident description.[10] In our sample, there is an average of 6.5 rapes per day.[11]

The dataset also includes other criminal and non-criminal offenses. Among them, we collected data on the most frequently reported crimes and offenses, which together account for approximately 80% of the total number of reports. These are traffic offenses, community policing, disorder, theft (includes theft from vehicle, theft of a vehicle, robberies, property crime, and breaking & entering), and assault. Among these categories we group theft and assault as criminal offenses, and traffic offenses, community policing, and disorder as non-criminal offenses. Additionally, we create

---

[8] Other minor outages were on June 16th, 2017 at 10am for less than an hour; November 12th, 2018 at 5pm for an hour; November 18th, 2018 at 7pm for half an hour.
[9] Socrata provides a data-as-a-service platform bringing together existing government data. Datasets downloaded on April 21st, 2019 from https://moto.data.socrata.com/browse?limitTo=datasets.
[10] A police code is a numerical brevity code for a crime, incident, or instructions for police officers. https://en.wikipedia.org/wiki/Police_code and https://web.stanford.edu/~reneeb/bill/n.radio.code.html.
[11] 66% of the police stations do not report any rapes in our sample.

variables on drug and alcohol offenses by aggregating all offenses that include the word "drug" and "liquor" in the incident description, respectively. Table 1 reports summary statistics of the data.

III. Empirical strategy and results

We are interested in estimating the impact of YouTube outage on rapes during the 24 hours following the outage. Formally, we want to estimate the following equation:

$$Rapes_t = \alpha + \beta \; YouTube \; outage_t + \varphi \; X_t + \varepsilon_t \quad (1)$$

where $Rapes_t$ is the total number of rapes on day t, $YouTube \; outage_t$ is a dummy variable that takes the value one from October 16th, 2018, 9pm to October 17th, 2018, 8.59pm Eastern time, and zero otherwise, β is the parameter of interest, and ε_t is the error term. Depending on the particular specification the set of controls, X_t, includes day of the week dummies (7), month dummies (12), day of the month dummies (31), and a linear time trend (1 to 820).

We estimate equation (1) using Ordinary Least Squares (OLS). To deal with potential heteroskedasticity and serial correlation we follow the standard approach of reporting Newey-West robust standard errors.[12]

In column (1) of table 2 we report estimates of equation (1) without controls. The coefficient on *YouTube outage* is positive and statistically significant at the 1 percent level. The value of the coefficient implies a 1.4 standard deviation increase in rapes in the 24-hour period following the outage. In columns (2) to (5) in table 2 we show that results are robust to controlling for day of the week dummies, month dummies, day of the month dummies, and a linear time trend.

Table 3 reports results for alternative time windows. We consider three symmetric periods around October 16th, 2018: September 1st to November 30th (91 days),

---

[12] In all cases, the heuristic applied to obtain the number of lags is taken from the first step of Newey and West's (1994) plug-in procedure that sets the number of lags as $floor[4(T/100)^{2/9}]$, where T is the number of observations.

September 16th to November 15th (61 days), and October 1st to October 31st (31 days). In all cases the coefficient on *YouTube outage* is positive and statistically significant, with estimated values in a similar range as the ones reported in table 2.

Table 4 reports results obtained from restricting the sample to the 24-hour period starting on Tuesdays at 9pm Eastern time. There are 117 "Tuesdays" in our sample. Again, the coefficient for *YouTube outage* is positive and statistically significant, with estimated values that imply an increase in rapes in the range of 1.6 to 2.8 standard deviations,[13] depending on the particular specification.

Finally, figure 2 plots the distribution of rapes in the 117 Tuesdays in our sample, and shows that only 3.42% of Tuesdays have more reported rapes than October 16th, 2018.[14]

IV. Underlying mechanisms

In this section we investigate various potential underlying mechanisms that may link the YouTube outage to the subsequent observed increase in rapes. We explore (i) direct effect of the outage on other (not sexual related) crimes and offenses, (ii) the effect of the outage on drug and alcohol offenses, (iii) time substitution, and (iv) pornography viewing.

First, we analyze the effect of the outage on criminal offenses (theft, assault, property crime, theft from vehicle, breaking & entering, and theft of vehicle) and non-criminal offenses (traffic offenses, disorder, community policing, and vehicle stop). As shown in table 5, there is no significant association between *YouTube outage* and criminal and non-criminal offenses. Overall, these results suggest there is no direct effect of the outage on other crimes and offenses.

---

[13] The standard deviation of *Rapes* in the sample of Tuesdays is equal to 2.75.
[14] These Tuesdays are 08/22/2017, 05/15/2018, 06/12/2018, and 07/10/2018.

Second, we investigate the effect of the outage on drug and alcohol offences.[15] Table 6 shows that the outage is not significantly related to an increase in drug offenses nor to an increase in alcohol offenses.

Third, we explore the time-substitution channel. The hypothesis is that watching YouTube and committing rape are substitutes. This may arise, for example, because individuals that were unable to access YouTube get bored and react by committing rape. An observational implication of the time-substitution channel is that we should observe an increase in rapes during the outage (that is, in the 2-hour period starting at 9pm Eastern time on Tuesday 16th, 2018). To explore this potential channel we construct an hourly dataset for the period January 1st, 2017 to March 31st, 2019 (19,680 hours). An anticipation of time-substitution results is reported in Figure 3, which shows there is no increase in rapes during the outage, and all the observed increase occurs after the service was restored. To formally test the time-substitution channel, we generate two new variables. *During outage* is a dummy variable that takes value 1 in the 2-hour period 9pm to 10.59pm Eastern time on Tuesday 16th, 2018. *After outage* is a dummy variable that takes value 1 in the 22-hour period starting at 11pm Eastern time on Tuesday 16th, 2018. As reported in table 7, all the observed effect comes from rapes in the 22-hour period after the outage. Indeed, rapes fell during the outage. These findings do not support the time-substitution channel.

Finally, we explore the pornography-viewing channel. During the YouTube's disruption there was an important increase in traffic on the online adult video site Pornhub, the world's biggest pornography site. The top panel of figure 4 displays hourly data on YouTube reported problems. The bottom panel of figure 4 displays hourly data on Pornhub's traffic from noon Eastern time October 16th, 2018, until 2am Eastern time

---

[15] Approximately one-half of sexual assaults involve alcohol consumption by the perpetrator, victim, or both (Abbey et al. 2001).

October 17th, 2018. The Pornhub site saw a surge in traffic during YouTube's outage: traffic increased to 12 percent above average at around 9pm Eastern time, when the outage was reported, climbing to 21 percent increase over average traffic one hour later. According to information provided by Pornhub site, this increase in traffic implies millions of additional viewers during Pornhub's peak hours. Traffic dropped rapidly once YouTube's service was restored, dropping to slightly below average numbers around midnight Eastern time.[16]

If YouTube viewers were switching to Pornhub during the outage, there must be some substitutability between these two sites. What were YouTube users viewing before the outage? What happened to Pornhub searches during the outage? According to information provided by Pornhub, ASMR (Autonomous Sensory Meridian Response) was the word with the highest search growth during YouTube outage:[17] ASMR searches in Pornhub increased by 201% compared to the October 16th, 2018, hourly average. In Pornhub, searching for ASMR leads to hardcore material that combines the sound effects of ASMR with explicit sexual content. Even though we do not have information on YouTube searches around the outage, there is evidence that ASMR searches are very popular on YouTube,[18] and therefore it is likely that YouTube users that were searching for ASMR at that site switched to searching for ASMR at Pornhub.

Finally, according to specialized literature (see Schmidt 1975; Both et al. 2004), sexual arousal (and the increase in sexual activity) after pornography viewing last for up

---

[16] Using hourly data on YouTube reported problems and Pornhub traffic for the 15-hour window around the outage (from noon October 16th until 2am October 17th, Eastern time), we run a regression of Pornhub's traffic on YouTube reported problems. As expected, the estimated coefficient is positive and highly significant (the estimated coefficient is 0.11, with a standard error of 0.01), indicating that the outage is highly correlated with pornography viewing.

[17] ASMR is an experience or feeling triggered by specific auditory or visual stimuli, such as quiet and whispery noises, usually accompanied by feelings of relaxation and well-being.

[18] According to BBC news, there are over 13 million videos of people trying to trigger ASMR feeling on YouTube.

to 24 hours, so our findings are compatible with pornography viewing being the channel behind the observed increase in rapes in the 22-hour period after the outage.

Overall, we conclude that evidence only supports the mechanism of pornography viewing. In the following section we develop a simple model to rationalize our interpretation that pornography viewing increases rapes.

V. Theoretical framework: pornography viewing and rapes

We focus on the behavior of potential male sexual offenders.[19] Our model has 2 stages. In the first stage, the agent decides how much pornography to consume subject to his time constraint. In the second stage, the agent decides whether or not to rape taking into account the costs and benefits associated to raping. Important to our setting is that in the first stage the agent is unable to predict perfectly his future behavior if he were sexually aroused in the second stage. The behavioral economics literature names this as the hot-cold empathy gap, a cognitive bias in which individuals underestimate the influences of visceral factors (such as sexual arousal) on their own future behavior (Loewenstein 2000).

Formally, sexual arousal of individual i (v_i) depends on the consumption of pornography by individual i, X_{iP}. We assume that sexual arousal increases with the consumption of pornography, $v_i'(X_{iP}) > 0$. An agent is in "hot" or "cold" mode depending on whether sexual arousal is above or below a personal threshold, $\bar{v}_i$. An agent is in hot mode if $v_i(X_{iP}) \geq \bar{v}_i$, and he is in cold mode if $v_i(X_{iP}) < \bar{v}_i$.

We assume that in the first stage, being in cold mode, the agent naively predicts that in the second stage his sexual arousal will always be below his personal threshold (i.e, that in the second stage he will always be in cold mode). Under this assumption, in the first stage the agent solves the following maximization problem, where X_{iY} is

[19] Since males are by far the predominant perpetrators of rapes as well as the biggest consumers of pornography (see, for example, Russell 1984), we are calling the offender a "he."

YouTube consumption, X_{iO} is the consumption of all other leisure activities, and L_i is leisure endowment (X_{iP}, X_{iY}, X_{i0}, and L_i are measured in hours):

$$max\ U(X_{iP}; X_{iY}; X_{iO}), \text{ s.t. } X_{iP} + X_{iY} + X_{i0} \leq L_i, \text{ for } i = 1, \dots, N.$$

The agent solves this problem and chooses the optimal bundle of leisure consumption, including the optimal consumption of pornography (X_{iP}^*).[20]

In the second stage the agent decides whether or not to rape conditional on the amount of pornography viewing chosen in the previous stage. According to the rational crime model (Becker 1968), the agent decides whether or not to rape by comparing the costs and benefits of raping. In our model we follow the behavioral economics literature and we assume that being in hot mode affects both perceived costs and benefits of raping: it decreases the perceived cost of being caught (see Nagin 2008; Van Winden and Ash (2012) and increases the utility from raping (Loewenstein 2000).[21]

For simplicity, we normalize the utility of not raping at zero. Thus, the agent rapes if the utility from raping is greater than zero. Formally, the agent rapes if

$$U(Rape) = \alpha + \beta \mathbf{1}(v_i(X_{iP}^*) \geq \bar{v}_i) - \left(c - \delta \mathbf{1}(v_i(X_{iP}^*) \geq \bar{v}_i)\right) > 0,$$

where $\mathbf{1}(v_i(X_{iP}^*) \geq \bar{v}_i)$ is an indicator that takes the value one if the agent is in hot mode, $\alpha, \beta,$ and δ are parameters greater than zero, c is the agent's expected cost of being caught (includes the probability of being caught and the length of the sentence), and $(c - \delta \mathbf{1}(v_i(X_{iP}^*) \geq \bar{v}_i))$ is the agent's perceived cost of being caught. We assume $\alpha < c$ and $\alpha + \beta + \delta > c$.

In the cold mode, $v_i(X_{iP}^*) < \bar{v}_i$, and $U(Rape) = \alpha - c$. Since $\alpha < c$, in the cold mode the agent decides not to rape. In the hot mode the agent rapes since $v_i(X_{iP}^*) \geq \bar{v}_i$, and $U(Rape) = \alpha + \beta - c + \delta > 0$.

---

[20] We assume local non-satiation so that the time constraint will hold with equality.
[21] In general, visceral factors determine the trade-off between different goods and activities; thirst, for example, increases one's preference for water, and sexual arousal increases one's preference for having sex (Loewenstein 2000).

In terms of our model, YouTube outage implies an additional restriction to the optimization problem: $X_{iY} = 0$. This implies that, in equilibrium, some agents end up consuming more pornography, thus increasing the probability of being in hot mode.

To round off, YouTube outage decreases the opportunity cost of pornography viewing relative to alternative activities, thus potentially increasing the equilibrium level of pornography viewing. The increase in pornography viewing leads to some agents crossing their sexual arousal threshold. Those agents that cross the threshold end up raping.

VI. Final remarks

YouTube experienced a major global interruption on October 16th, 2018. Using high-frequency crime data from the U.S., we document an increase in the number of rapes in the 24-hour period following the outage. We explore various competing mechanisms and we find support to the increase in rapes being driven by an increase in pornography viewing.

The observed association between the increase in pornography viewing and the increase in rapes can be rationalized by combining previous research in psychology and behavioral economics. Research in psychology indicates that an important fraction of male students in the U.S. (25 to 30 percent) admit to some likelihood of raping or forcing sex acts on a woman if they could get away with it (Malamuth 1984; Edwards, Bradshaw, and Hinsz 2014). The behavioral economics literature indicates that under the influence of visceral factors (such as being sexually aroused) individuals decide without fully taking into account the consequences of their acts. In a nutshell, our framework postulates that pornography viewing increases sexual arousal, which in turn increases the utility from raping and decreases the perceived cost of being caught, thus increasing the probability of raping.

Table 1. Summary statistics of crime data

	Mean	Standard deviation	Minimum	Maximum
Rapes	6.54	3.21	0	21
Criminal offenses	1,944.22	209.46	1,062	2,481
Non-criminal offenses	4,820.63	533.67	2,358	6,692
Theft	1,681.26	203.64	882	2,197
Assaults	295.23	43.40	180	458
Traffic offenses	1,690.13	217.64	653	2,274
Community policing	1,580.68	178.14	856	1,988
Disorder	1,010.76	248.87	447	2,323
Alcohol offenses	53.04	21.09	17	140
Drug offenses	187.49	25.72	66	260
Observations	820			

Notes: Table 1 reports summary statistics of "daily" data. Data was constructed using the date and time of the incident, and normalized so that all "days" start at the time of the outage (9pm Eastern time). Criminal offenses include theft (a category that includes theft from vehicle, theft of vehicle, property crime, robberies, and breaking & entering) and assaults. Non-criminal offenses include traffic offenses, community policing, and disorder.

Table 2. Impact of YouTube outage on rapes

	Dependent variable: Rapes				
	(1)	(2)	(3)	(4)	(5)
YouTube outage	4.47***	4.41***	4.16***	4.36***	3.62***
	(0.16)	(0.25)	(0.61)	(0.95)	(0.84)
R-squared	0.002	0.094	0.105	0.187	0.260
Day of the week	No	Yes	Yes	Yes	Yes
Month	No	No	Yes	Yes	Yes
Day of month	No	No	No	Yes	Yes
Time trend	No	No	No	No	Yes
Observations	820	820	820	820	820

Notes: Table 2 uses daily data for the period January 1st, 2017 to March 31st, 2019. Newey-West heteroskedasticity- and autocorrelation-consistent standard errors are in parentheses. *Significant at the 10% level. **Significant at the 5% level. ***Significant at the 1% level.

Table 3. Robustness checks: alternative time windows

	(1)	(2)	(3)
	Dependent variable: Rapes		
YouTube outage	2.97***	2.92***	4.00***
	(0.57)	(0.64)	(0.95)
Day of the week	Yes	Yes	Yes
Month	Yes	Yes	Yes
Time trend	Yes	Yes	Yes
Observations	91	61	31

Notes: Table 3 considers three symmetric periods around October 16th, 2018: September 1st to November 30th (91 days), September 16th to November 15th (61 days), and October 1st to October 31st (31 days). Newey-West heteroskedasticity- and autocorrelation-consistent standard errors are in parentheses. *Significant at the 10% level. **Significant at the 5% level. ***Significant at the 1% level.

Table 4. Robustness checks: 24-hour period around Tuesdays evening

| | Dependent variable: Rapes | | | |
	(1)	(2)	(3)	(4)
YouTube outage	4.41***	5.00***	7.60***	6.98***
	(0.25)	(0.55)	(1.59)	(1.40)
Month	No	Yes	Yes	Yes
Day of month	No	No	Yes	Yes
Time trend	No	No	No	Yes
Observations	117	117	117	117

Notes: Table 4 reports results obtained from restricting the sample to the 24-hour period starting on Tuesdays at 9pm Eastern time, for the period January 1st, 2017 to March 31st, 2019. Robust standard errors are in parentheses. *Significant at the 10% level. **Significant at the 5% level. ***Significant at the 1% level.

Table 5. Mechanisms: other crimes and offenses

	(1) Criminal offenses	(2) Non-criminal offenses	(3) Theft	(4) Assaults	(5) Traffic offenses	(6) Community Policing	(7) Disorder
YouTube outage	-45.21	-83.70	-71.58***	-10.13*	-43.35	-40.09*	-0.25
	(35.60)	(73.06)	(17.99)	(6.14)	(30.29)	(21.41)	(42.89)
Observations	820	820	820	820	820	820	820

Notes: Criminal offenses include theft (a category that includes theft from vehicle, theft of vehicle, property crime, robberies, and breaking & entering) and assaults. Non-criminal offenses include traffic offenses, community policing, and disorder. Newey-West heteroskedasticity- and autocorrelation-consistent standard errors are in parentheses. *Significant at the 10% level. **Significant at the 5% level. ***Significant at the 1% level.

Table 6. Mechanisms: drug and alcohol offenses

|	(1) Drug offenses	(2) Alcohol offenses
Youtube outage	3.21	-18.64***
	(5.50)	(2.49)
Day of the week	Yes	Yes
Month	Yes	Yes
Day of month	Yes	Yes
Time trend	Yes	Yes
Observations	820	820

Notes: Newey-West heteroskedasticity- and autocorrelation-consistent standard errors are in parentheses. *Significant at the 10% level. **Significant at the 5% level. ***Significant at the 1% level.

Table 7. Mechanisms: time substitution

	Dependent variable: Rapes					
	(1)	(2)	(3)	(4)	(5)	(6)
During outage	-0.27***	-0.27***	-0.27***	-0.28***	-0.29***	-0.32***
	(0.00)	(0.01)	(0.02)	(0.02)	(0.03)	(0.03)
After outage	0.23**	0.23**	0.23**	0.21**	0.22**	0.19*
	(0.10)	(0.10)	(0.10)	(0.10)	(0.10)	(0.10)
Hour of the day	No	Yes	Yes	Yes	Yes	Yes
Day of the week	No	No	Yes	Yes	Yes	Yes
Month	No	No	No	Yes	Yes	Yes
Day of the month	No	No	No	No	Yes	Yes
Time trend	No	No	No	No	No	Yes
Observations	19,680	19,680	19,680	19,680	19,680	19,680

Notes: Table 7 uses hourly data dataset for the period January 1st, 2017 to March 31st, 2019. *During outage* is a dummy variable that takes value 1 in the 2-hour period 9pm to 10.59pm Eastern time on Tuesday 16th, 2018. *After outage* is a dummy variable that takes value 1 in the 22-hour period starting at 11pm Eastern time on Tuesday 16th, 2018. The variable *Rapes* has an hourly average equal to 0.27. Newey-West heteroskedasticity- and autocorrelation-consistent standard errors are in parentheses. *Significant at the 10% level. **Significant at the 5% level. ***Significant at the 1% level.
